

## IC Design HW3 Tutorial

Tzung-Han Juang

Professor: Tzi-Dar Chiueh

2018/11/23

## **Outline**

- Introduction to Verilog
  - Module
  - Value & number
  - Data type
- Neverilog simulation & nWave tool

## Introduction to Verilog

Module
Value & Number
Data Type

## What is Verilog

- Verilog is a Hardware Description Language (HDL)
  - Describe digital electronic system at multiple levels of abstraction
  - Model the timing
  - Express the *concurrency* of the system operation
  - Test the system

## **Behavioral Model of Circuits**

System concept

Algorithm

Increasing behavioral abstraction

Architecture

Register Transfer Level

**Gate Level** 

**Transistor Level** 

Increasing detailed realization & complexity

# Verilog-Supported Levels of Abstraction

#### Behavioral

- Structural and procedural like the C programming language
- Describe algorithm level and RTL level Verilog models
- Register Transfer Level (RTL)
  - Describe the flow of data between registers and how a design process these data.

#### Structural

- Describe gate-level and switch-level circuits.

High

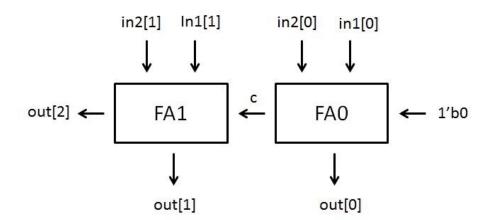

Low

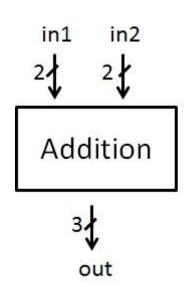

## The Verilog Module

- Basic building blocks.
- Begin with module, end with endmodule

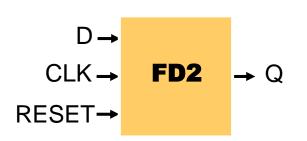

module <module name>(<port lists>); //module description endmodule

### **Module Ports**

- Modules communicate through ports
  - input
  - output
  - inout (bidirectional)

```
module FD2 (Q, D, CLK, RESET);

output Q;
input CLK, D, RESET;

//module description

endmodule
```

## 4-Value Logic System

- 0
  - zero, false, low
- 1
- one, true, high
- Z
  - high impedance, floating
- X
  - unknown, occurs at un-initialized storage elements or un-resolvable logic conflicts

### Value and Number

- [[<size>]'<radix>]<value>
  - Size
    - The size in bits
    - Default size is 32 bits
  - Radix
    - b (binary), o (octal), d (decimal), h (hexadecimal)
    - Default radix is decimal
  - Value
    - Any legal number in selected radix, including "x" and "z"
- Radix and value are case-insensitive

## Value and Number - Examples

```
4'b1001 // 4-bit binary
5'd3
        // 5-bit decimal
12'h7ff // 12-bit hexadecimal
3'bx10 // 3-bit binary with
          unknown MSB
4'b101x // 4-bit binary with
          unknown LSB
12'hx // 12-bit unknown
-8'd6 // phrase as -(8'd6)
```

underline usage

```
- 16'b0001_0101_0001_1111
```

32'h12ab\_f001

X and Z is sign-extended

```
- Ex. 12-bit a
    a = 'h x; // yields xxx
    a = h 3x; // yields 03x
    a = h 0x; // yields 00x
```

## **Data Type Classes**

#### wire

- wire [MSB:LSB] variables;
- input, inout, output are default to be wire.
- Used to describe combinational circuit!

#### reg

- reg [MSB:LSB] variables
- Used to describe combinational or sequential circuit.

## Assign a value to wire

wire

```
- "assign "
    wire a;
    assign a = 1'b1;
- Output port
    wire a;
    wire b;
    assign b = 1'b0;
    NOT n0(a, b);
```

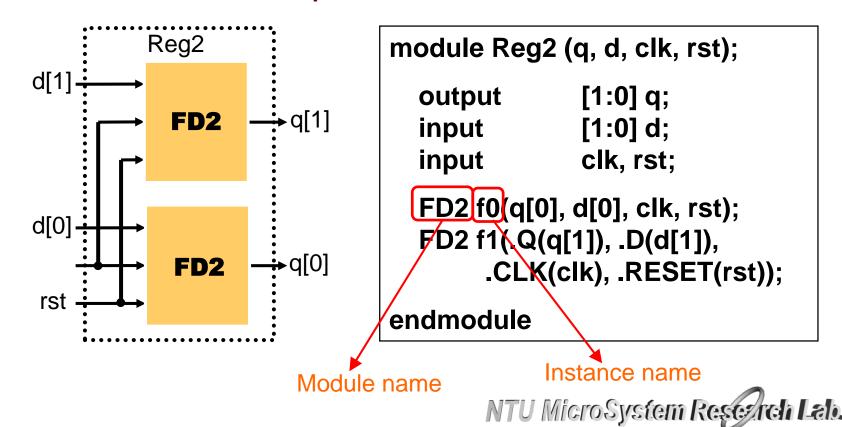

Every wire can be only assigned once!!!

```
wire a;
wire b;
assign b = 1'b0;
NOT n0(a, b);
assign a = 1'b0; //Wrong!!!
```

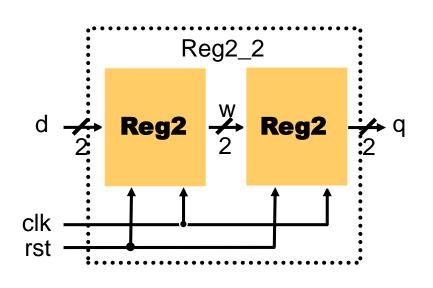

## Module Instances (1/2)

 Create a higher-level system by connecting lower-level components

## Module Instances (2/2)

```
module Reg2_2 (q, d, clk, rst);

output [1:0] q;
input [1:0] d;
input clk, rst;

wire [1:0] w;

Reg2 r0(w, d, clk, rst);
Reg2 r1(q, w, clk, rst);
endmodule
```

## **Net Concatenations**

Representation	Meaning
{b[3:0],c[2:0]}	{b[3],b[2],b[1],b[0],c[2],c[1],c[0]}
{a,b[3:0],w,3'b101}	{a,b[3],b[2],b[1],b[0],w,1'b1,1'b0,1'b1}
{4{w}}	{w,w,w,w}
{b,{3{a,b}}}	{b,a,b,a,b,}

## Standard Cell Library (lib.v)

- Choose what you need
- Compose your circuit according to I/O connections

```
module AN3(Z,A,B,C);

output Z;
input A,B,C;

// netlist
and g1(Z,A,B,C);

// specify block, declare local
// timing constant
specify
```

```
// delay parameters
specparam Tp_A_Z = 0.275;
specparam Tp_B_Z = 0.275;
specparam Tp_C_Z = 0.275;
// path delay (full connection)
( A *> Z ) = ( Tp_A_Z );
( B *> Z ) = ( Tp_B_Z );
( C *> Z ) = ( Tp_C_Z );
endspecify
```

endmodule

# Standard Cell Library (lib.v) - 2/2

- IV // not
- AN3
- AN4
- AN2
- EN // xnor
- EN3
- EO // xor
- EO3
- FA1 // full adder
- FD1 // DFF
- FD2

- ND2 // nand
- ND3
- ND4
- NR2 // nor
- NR3
- OR2 // or
- OR3
- OR4
- HA1 // half adder
- MUX21H // 2-to-1 MUX

### **Notification**

• In this HW, all the logic operation MUST consist of standard cell. You can NOT use logic operators.

```
wire a, b, c;
AN2 an(a, b, c);
```

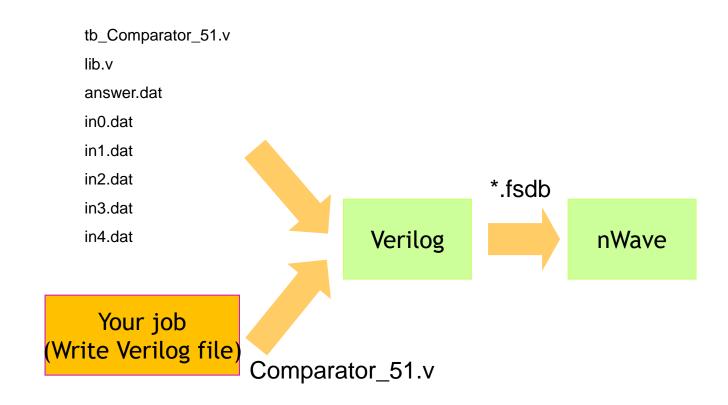

## Example

FA1 fa0(c, out[0], in1[0], in2[0], 1'b0); FA1 fa1(out[2], out[1], in1[1], in2[1], c); endmodule

## Flow chart

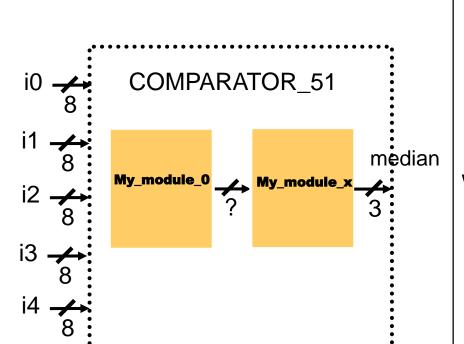

All these files should be placed under the same folder

NTU MicroSystem Research Lab.

21

### Your Job

```
module COMPARATOR_51(median,
i0, i1, i2, i3, i4);
  output
               [2:0] median;
  input
              [7:0] i0, i1,i2, i3, i4;
\\ Write your design here
               [?:0] ...;
  wire
  My_module_0 M0(?, ?, ..., ?);
  My_module_x Mx(?, ?, ..., ?);
endmodule
```

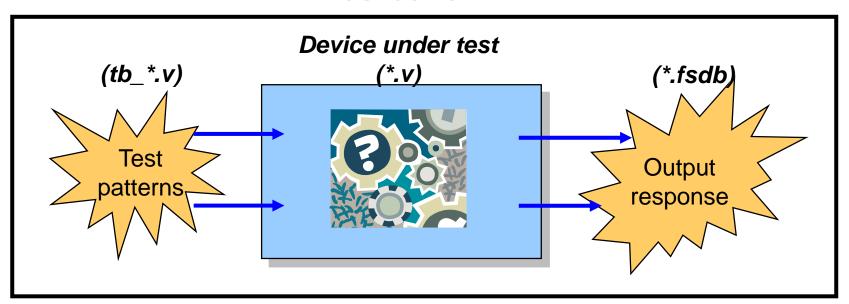

## Neverilog Simulation & nWave Tool

# Test and verification your circuit

By applying input patterns and observing output responses

#### **Testbench**

## Compile and debug (1/2)

- Source
  - source /usr/cadence/cshrc
  - source /usr/spring\_soft/CIC/verdi.cshrc
- Include the testbench & lib.v files to run simulation
  - ncverilog +access+r tb\_Comparator\_51.v Comparator\_51.v
     lib.v

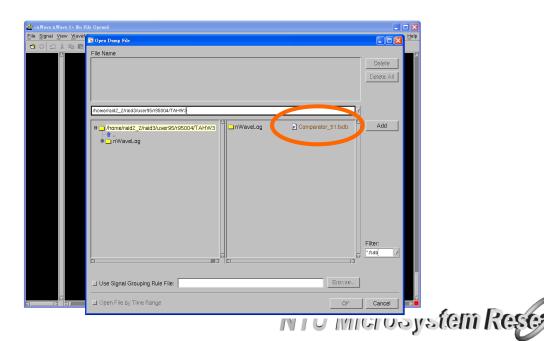

## Compile and debug (2/2)

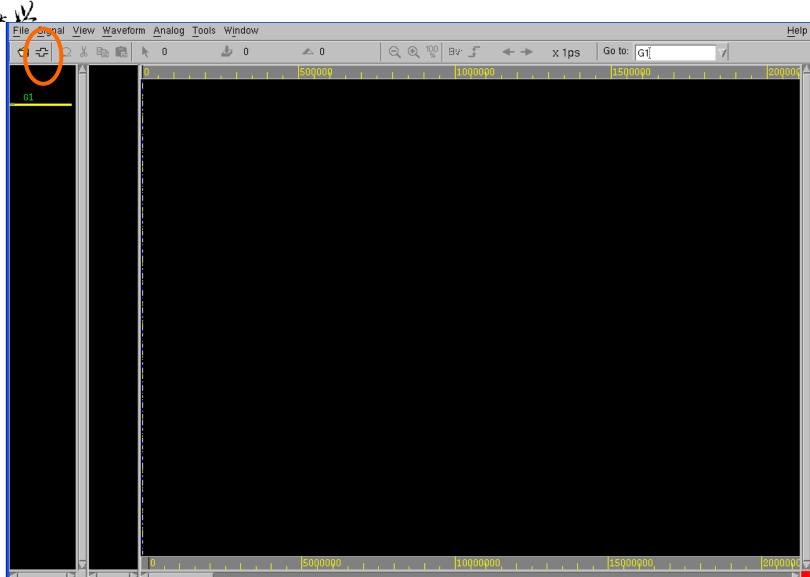

## Execute nWave & Open \*.fsdb

- Execute : *nWave &*
- Open waveform file:
  - File -> Open -> Comparator\_51.fsdb

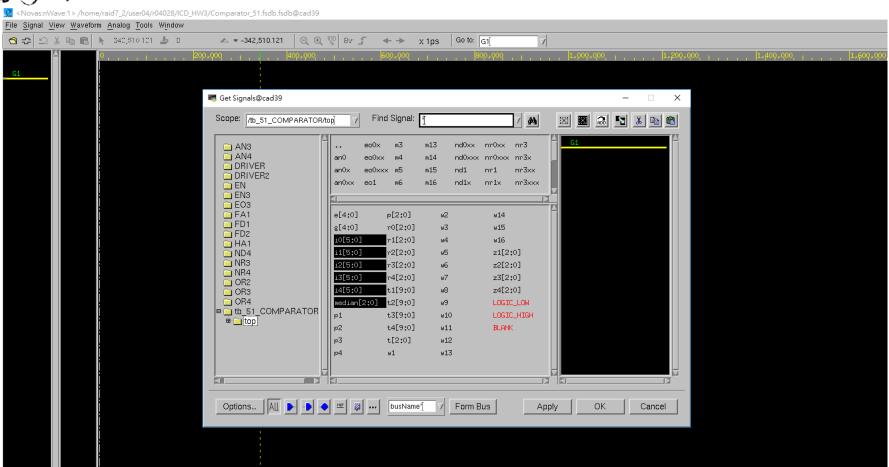

# Get signals

## Find Top Module & Choose signals

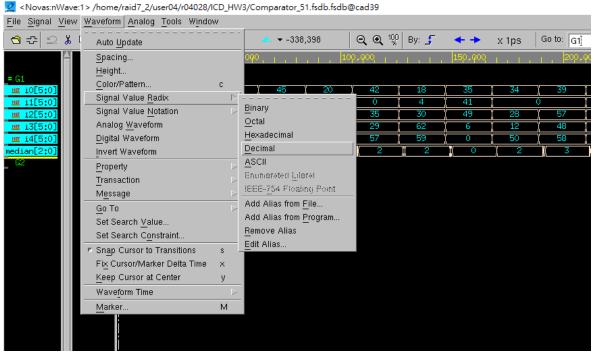

# Change the radix to be decimal
